

The distillation database is a compilation of test results obtained with the Separations Research Program's 18" distillation tower (one test performed on 4" distillation tower). This column has been in service since 1988. Most of the tests were performed with our standard cyclohexane/n-heptane mix at total reflux. Typical pressures include 2.4, 4.83, 15.4, 24, and 60 psia.
